SUBJECT: PCB Results of Sediment Trap Samples near General Metals

Since July 1990 the Toxics Investigations Section, of the Environmental Investigations and Laboratory Services Program (EILS) has been conducting a sediment monitoring study in Hylebos Waterway with the use of moored sediment traps. The locations of the traps are shown in Figure 1. The primary objective of this study is to determine the concentrations of problem chemicals associated with settling particulate matter (SPM) currently entering Hylebos Waterway. The data collected are being used to evaluate the effectiveness of source control programs in reducing inputs of problem chemicals to the waterway.

Polychlorinated biphenyls (PCBs) were identified as problem chemicals in Hylebos Waterway during the Commencement Bay Nearshore/Tideflats Remedial Investigation. Consequently, PCBs are one of the target analytes in the sediment trap study. The results of PCB analysis of SPM samples from the sediment trap study are summarized in Table 1. Of particular concern is the high concentration measured for PCB 1242 (73,000 ug/kg, dry) from the most recent sample collected near General Metals. This concentration is well in excess of the Commencement Bay Cleanup Objective of 1000 ug/kg, dry. In addition, on an organic carbon (OC)-normalized basis (1600 mg/kg OC) it also exceeds Ecology's Sediment Management Standard of 12 mg/kg OC for total PCBs. I have examined the quality assurance data associated with these data and it is of acceptable quality.

Aside from the high concentration, the unusual aspect of this result is that PCB 1242 has been rarely detected in Hylebos Waterway. One noteworthy exception was during a PCB screening study of Hylebos Waterway (see Stinson *et al.*, 1987 attached) PCB 1242 was detected in several catch basin sediments from General Metals. These results are summarized in the attached memorandum dated October 23, 1986, from myself to Tom Eaton.

Given the drainage system modifications that are currently underway at General Metals, the source of PCB 1242 remains a mystery. However, the magnitude of this concentration probably warrants further investigation. Please give me a call if you need additional information.
